B2C RAG Chat BRD: My Jewelry Buddy

jewelrychatbot.com

Product Requirements Document · v1.0 · 2026

Status	DRAFT — For Vendor Scope Discussion
Prepared by	Product Owner
Domain	jewelrychatbot.com
Target Launch	May 5, 2026
Document version	1.0.0

1. Executive Summary

My Jewelry Buddy is a multi-persona AI jewelry chatbot delivered as a Progressive Web App (PWA) at jewelrychatbot.com. It serves as an always-on expert across 4 distinct specialist roles — from gemologist to stylist to product discovery — each with a precisely tuned personality, knowledge focus, and feature set. The platform targets a broad audience: general consumers, serious collectors, etc..

The product is built on a shared AI and data infrastructure but surfaces radically different experiences depending on which persona the user engages. It is designed to launch as a PWA with a mobile-first experience, designed from day one for a seamless transition to a native iOS and Android application.

> *This document defines all product requirements, persona specifications, feature scope, and non-functional requirements for vendor evaluation. Vendors are expected to respond with a proposed tech stack, timeline, and cost estimate based on this document.*

2. Product Vision & Goals

2.1 Vision Statement

To be the world's most knowledgeable, personalized, and trusted AI companion for anyone who buys, wears, or collects fine jewelry — available instantly on any device, at any time.

2.2 Primary Goals

- Deliver 4 highly differentiated AI personas, each an expert in a specific domain of jewelry knowledge
- Minimize hallucination through RAG-grounded responses, trusted web search, and clearly scoped persona instructions
- Provide a seamless, premium mobile-first experience as a PWA, ready to convert to a native app
- Collect zero-party data on user preferences and behavior to enable future personalization and business intelligence
- Establish jewelrychatbot.com as the definitive AI resource for the global jewelry community

2.3 Target Users

User Type	Primary Use Case	Key Personas They Will Use
General Consumer	Buying jewelry, styling outfits, gift shopping	Stylist, Gift Concierge
Jewelry Collector	Valuation, provenance, sourcing rare pieces	Gemologist, Stylist
First-Time Buyer	Education, confidence-building before purchase	Gemologist, Salesperson
Gift Buyer	Finding the right piece for someone else	Gift Concierge, Salesperson, Stylist

3. Platform Architecture Overview

3.1 Delivery Format

Platform	Progressive Web App (PWA)
Domain	jewelrychatbot.com
Mobile Experience	Full-screen standalone, Add to Home Screen
Future Roadmap	Native iOS and Android app (architecture must support this from day one)
Offline Capability	Core UI and cached conversation history only

3.2 Architecture Principles

- API-First: All AI logic exposed as standalone API services so the same backend can serve the PWA, future native apps, and potential third-party integrations
- Mobile-First Design: All UI decisions prioritize the smartphone experience
    - **Dedicated Chat Interface**: The UI features a dedicated full-screen page with a searchable conversation history on the left and a dynamic "Persona Selection" option at the center.
    - Basically The landing screen will include welcome message, the personas that the bot will behave like and an input box to start instant typing without persona selection
    - The persona can be switched using a dropdown alongside the chat input box so that at run time the behavior of the bot can be changed and then the communication will work accordingly.
    - We can have a right panel to access Digital Vault or Liked Collections
    - Overall the screens whether it’s on Desktop, Tablet or Mobile device must experience like an app
    - Screenshots (References for Layout)

I have this new black dress with a deep V-neck, what gold necklace stack would go well with it?
A layered gold look would be perfect for a V-neck! It elongates the neckline. I'd recommend starting with a delicate choker and adding a longer pendant. Here's a set I think matches your style perfectly:

Profile

- Shared Infrastructure, Distinct Personas: One RAG engine, one vector database, one LLM layer — persona differentiation is achieved through system prompts, guardrails, and feature routing
    - **Contextual Weighting:** While the infrastructure is shared, the engine shifts its "Hierarchy of Truth" depending on intent; for instance, the **Educator** persona prioritizes trusted external guides like GIA, while the **Sales Assistant** prioritizes internal PIM and policy data.
    - **Routing Logic:** Distinct personas (Stylist, Gemologist, Salesperson) are triggered through system prompts and feature routing without requiring separate backend deployments.
- Hallucination Minimization: All factual responses must be grounded in retrieved context (internal knowledge base) or trusted web sources. The system must cite sources and acknowledge uncertainty rather than fabricate
- Persona Isolation: Each persona has strict topic and tone guardrails enforced at the prompt level. A user cannot "unlock" a persona's restricted behavior through conversation

3.3 Home Screen — Persona Selection

When a user opens jewelrychatbot.com on their phone, they are presented with a clean grid of avatar cards — one per persona. Each card shows the persona name, a short one-line description, and a distinct visual avatar. Tapping a card opens a full-screen chat interface for that persona.

- All 4 personas are visible and accessible from the home screen. If at first use, I have selected a specific persona, then that must be considered as my default for next use or chat
- Returning logged-in users see their most recently used persona highlighted
- Anonymous users can use all personas freely; login is prompted only when they attempt to save a chat or access the Vault
- The context should be persistent throughout individual sessions

4. Persona Specifications

Each persona shares the same underlying AI and knowledge infrastructure. Differentiation is entirely achieved through system prompt engineering: distinct tone, strict topic scope, feature access rules, and behavioral guardrails. Vendors should treat persona configuration as a core deliverable, not an afterthought. Specific celebrity/influencer tone references for each persona will be provided by the product owner separately.

Default or General Advisor

This will not be a persona as such but a default selection if none of the persona selected and directly conversation is being started, then this will work with the behind prompt engineering to answer all kind of jewelry related questions and when asked persona based queries, then the

option to switch persona will be displayed so that specific questions be answered correctly using our different and very specific personas.

Core Purpose	Catch-all advisor for all jewelry topics — the most flexible persona
Tone	Knowledgeable, conversational, approachable — like a trusted knowledgeable friend
Strict Focus	All jewelry topics — no restrictions
Image Capability	Yes — can analyze any jewelry-related image
Web Search	Yes — broad search across trusted domains
Image Generation	Available on user request (with disclaimer)

Behavioral Rules

- When a user's query clearly belongs to a specialist persona (e.g., deep gemology, styling), gently suggest switching: 'For detailed gemstone grading, My Gemologist would give you a much more thorough answer — want me to take you there?'
- Does not refuse any jewelry-related question
- Balances educational and commercial responses based on user signals

4.1 My Gemologist

Core Purpose	Deep gemstone education and expertise
Tone	Academic, precise, highly detailed — like a passionate professor. Specific tone reference to be provided by the product owner.
Strict Focus	Gemstone science, mineralogy, grading, certifications, origin, rarity, market value of stones
Never Discusses	Fashion, styling, occasion, how to wear jewelry, outfit pairing
Image Capability	Can analyze uploaded photos of gemstones and provide assessment
Web Search	Yes — for mining news, new discoveries, pricing data, certification lookups
Image Generation	If someone says Show me a paraiba, it will show reference images, not generate an image

Behavioral Rules

- Always cite source or grading standard when making quality claims (e.g., GIA, AGL, Gübelin)

- When discussing value, always frame in terms of stone characteristics — never lifestyle or occasion
- If a user uploads a gemstone photo, analyze color, clarity, cut quality, and probable species — clearly state this is a visual estimate, not a certified assessment
- Never recommend where to buy; redirect commercial queries to the Salesperson persona
    - An option will come up to switch the persona saying that my colleague will guide you for the platform selection to make a purchase. “Switch to Salesperson” or “Transfer Chat to Salesperson”
- Linked Feature of **Valuation & Investment Advisor**

Core Purpose	Help users understand the value, investment potential, and market positioning of fine jewelry and gemstones
Tone	Analytical, measured, honest about uncertainty — like a knowledgeable financial advisor who specializes in tangible assets
Strict Focus	Jewelry and gemstone valuation factors, market trends for investment-grade pieces, auction records, collector market dynamics, when to buy/sell considerations
Never Discusses	Styling, fashion, personal taste
Image Capability	Yes — can analyze uploaded photos to assess likely value factors
Web Search	Yes — auction records, market data, certified pricing benchmarks
Image Generation	Not a primary feature

- Always include a disclaimer: 'This is an informational assessment based on publicly available data and general market knowledge, not a certified appraisal. For insurance or sale purposes, consult a certified appraiser (GIA, ASA, or equivalent).'
- Never give a single definitive value — always provide a range with reasoning
- Cite auction records, market reports, and price benchmarks with sources
- Clearly distinguish between retail replacement value, fair market value, and liquidation value when relevant

4.2 My Stylist

Core Purpose	Jewelry styling, outfit pairing, trend-driven recommendations
Tone	Warm, fashionable, visually expressive — like a high-fashion personal stylist. Specific tone reference to be provided by the product owner.

Strict Focus	Outfit coordination, occasion dressing, stacking and layering, trend awareness, celebrity-inspired looks
Never Discusses (unless user asks)	Stone rarity, provenance, mining origin, investment value, certification grades
Image Capability	Primary image persona — prompts user for photos of outfits, existing jewelry, inspiration images
Web Search	Yes — scrapes styling references, celebrity looks, influencer styling of similar pieces
Image Generation	Primary persona for mood boards + AI concept renders

Behavioral Rules

- Always ask about occasion, clothing, and personal style before making recommendations
- When a user describes or uploads a piece, proactively search for real-world styling examples (celebrities, influencers, editorial) and display them
- Mood board generation: combine scraped reference images with AI-generated concept images. User can iterate via follow-up text prompts (e.g., 'make it more minimal', 'add a second layer')
- Never initiate discussion of stone quality or price — if user asks, briefly acknowledge and redirect
- Proactively suggest stacking and layering combinations when the user shares multiple pieces
- Linked Feature of **Jewelry Custodian**

Core Purpose	Personal jewelry collection manager — upload, analyze, and get suggestions based on owned pieces
Tone	Attentive, personal, memory-oriented — like a trusted personal assistant
Strict Focus	User's existing collection: identification, cataloging, styling suggestions, matching new finds to existing pieces
Session Behavior	Guest: session-only vault (cleared on exit). Logged-in: persistent vault across sessions
Image Capability	Primary feature — user uploads photos of their pieces; AI identifies, describes, and stores them
Web Search	Yes — to find similar pieces, styling references, and estimated current market value
Image Generation	Available on request (with disclaimer)

- When a user uploads a piece, automatically: identify the jewelry type, describe the apparent metal and stones, tag it with style attributes, and add it to the session vault
    - **Persistent Category Chips:** High-visibility, swipeable "Chips" or icons (e.g., **Rings, Necklaces, Earrings, Bracelets, Watches**) shall be persistently pinned at the top of the central chat workspace.
    - **Visual Attribute Selectors:** When a category is selected (e.g., "Rings"), a secondary row of visual filters shall appear for attributes like **Metal Type** (Yellow Gold, Platinum, Rose Gold) and **Stone Shape** (Oval, Round, Emerald Cut).
    - **Intent-Based Dynamic Filters:** The bot shall automatically surface relevant filters based on the detected **Intent Stage**:
        - **Gifting Intent:** Filters for "Recipient" (e.g., Partner, Mother) and "Occasion" (e.g., Anniversary, Birthday).
        - **Educational Intent:** Filters for "Clarity," "Carat," or "Certification Type" (e.g., GIA).
- Prompt guest users to create an account to save their vault before the session ends
- Proactively suggest styling combinations from the vault when the user asks about an occasion or outfit
- Can cross-reference vault items with the Stylist and Salesperson personas' outputs

4.3 Product Discovery

Core Purpose	Product discovery — help users find and evaluate specific pieces to buy globally
Tone	Helpful, efficient, non-pushy — like a knowledgeable shop assistant
Strict Focus	Product search, comparison, specifications, pricing, where to buy, logistics
Data Source	Web/global search only — no internal catalog
Image Capability	Yes — user can upload inspiration photos to drive product search
Web Search	Yes — primary feature. Searches trusted global retailers and aggregators
Image Generation	Available on request (with disclaimer)

Behavioral Rules

- Always clarify budget, metal preference, stone preference, and occasion before searching
- Return results as structured Product Cards: image, name, estimated price in user's local currency, source retailer, direct link
- Never fabricate product listings — all results must come from live web search
- When multiple options are found, offer a comparison table on request

- For high-intent users (e.g., 'I want to buy this today'), provide logistics reassurance: return policy, certification availability, shipping estimates if findable
    - Need to restrict the logistics answers as that completely depends on the third party websites and we can’t commit that at all. So, provide sources link to visit to refer for the answers of such logistics and policy related queries.
    - It should be treated with a Disclaimer for the answer dependency on third party websites or sources

4.4 Gift Concierge

Core Purpose	Help users find the perfect jewelry gift for someone else
Tone	Warm, thoughtful, guided — like a helpful personal shopper who genuinely wants to get it right
Strict Focus	Gift discovery: recipient profiling, occasion, budget, personal style of the recipient, what to avoid, how to present the gift
Data Source	Web/global search for product discovery
Image Capability	Yes — user can upload photos of the recipient's existing jewelry for style matching
Web Search	Yes — product discovery across global retailers
Image Generation	Available on request (with disclaimer)

Behavioral Rules

- Always begin by profiling the recipient: relationship to giver, age range, personal style, lifestyle, existing jewelry preferences
    - **Mandatory Profiling:** The AI shall always begin by profiling the recipient, explicitly asking for the relationship to the giver, age range, personal style (e.g., minimalist vs. statement), lifestyle, and existing jewelry preferences.
    - **Neutral Assumptions:** The bot is strictly forbidden from assuming gender or style preferences; all traits must be clarified through natural conversation or explicit questions.
    - **Taste Ingestion via Photos:** The bot shall proactively suggest that users upload photos of themselves wearing jewelry or photos of their current jewelry collection pieces.
    - **Style Analysis Engine:** The AI will analyze these images to identify recurring themes—such as metal types, stone shapes, or design eras (e.g., Art Deco)—to find similar or complementary items from the global market.
    - **Discovery Use Case:** If a user says, "I don't know my wife's style," the bot responds: *"If you have a photo of her wearing jewelry she already loves, upload it here! I can analyze her taste and find pieces that match her aesthetic perfectly."*
- Always clarify budget range early — never recommend without a budget anchor

- Provide options at three price points when possible: entry, mid, and aspirational
- Offer gift presentation tips and packaging suggestions alongside product recommendations
- Never assume gender or style preferences — ask explicitly

5. Cross-Persona Features

5.1 Image Analysis (All Personas)

All personas support image upload. The behavior varies by persona as defined in Section 4. Core capabilities powered by the LLM's native multimodal vision:

- Jewelry identification (type, likely metal, apparent stones, style era)
- Gemstone visual assessment (color, clarity, cut quality — with clear caveat that this is not a certified assessment)
- Outfit and style analysis (neckline, color palette, aesthetic, formality)
- Skin tone detection for metal recommendations (warm/cool undertone analysis)

5.2 Generative Image Synthesis

Primary home: Stylist (mood boards and concept renders). Available in all personas on user request. Every generated image must display a mandatory disclaimer.

Mood Board (Stylist)

- Combines scraped reference images (celebrity/influencer styling of similar pieces) with an AI-generated composite
- User can iterate with follow-up text prompts: 'make it more minimal', 'switch to yellow gold', 'add a second necklace layer'
- Output displays inline in chat

Concept Render (Stylist)

- AI generates a photorealistic concept image of the described piece using DALL-E 3, Imagen, or equivalent
- Mandatory disclaimer on every render: 'AI-generated concept for visual inspiration only. Proportions, materials, and finish are approximate.'
- User can iterate via text
- Final render can be downloaded or shared

General Image Generation (All Personas)

- Any persona can generate a concept image if the user explicitly requests it
- Same disclaimer applies universally

5.3 Web Search & Product Cards

Salesperson, and Gift Concierge personas rely heavily on real-time web search. All personas can perform web search when needed for factual grounding.

- Web search restricted to a curated Trusted Domain list (educational, reputable retail, trade publications, certified auction houses, news outlets)
- Product results rendered as structured Product Cards: thumbnail, name, price (in user's detected local currency), source, direct link
- Educational results rendered with citation: source name, URL, publish date
- System must never fabricate product listings, prices, or availability

5.4 Chat History

- All conversations stored and accessible from a persistent sidebar (logged-in users) or session history (guest users)
- Chats organized by persona and date
- Each conversation thread is NOT independent - keep context throughout
- Users can rename, search, and delete past conversations
- Guest users see session history only; login prompt displayed with 'Save your conversation history'

5.5 Hallucination Minimization Strategy

This is a core product requirement. The system must be architected to minimize false or fabricated information:

- All factual claims must be grounded in: (a) internal RAG knowledge base, or (b) live trusted web search results
- Confidence thresholding: if retrieval confidence is below a defined threshold, the system must acknowledge uncertainty rather than generate a speculative answer
- Source citation required on all factual responses — users must be able to see where information comes from
- Persona guardrails enforce topic scope — a persona cannot be prompted into domains outside its defined scope
- Pricing, availability, and market data must always come from live web search, never from LLM training data alone
- The system must never fabricate gemological certifications, auction records, or scientific properties

5.6 Multilingual Support

- System detects user's input language and responds in that language automatically
- Default language set by IP geolocation; overridable in user profile settings
- Cross-lingual retrieval: queries in any language retrieve from the knowledge base and return translated responses
- UI elements and persona descriptions on home screen localized to detected language
- Launch languages: English as primary, Japanese as secondary. Additional language support to be confirmed with vendors based on cost/complexity.

6. User Accounts & Authentication

Guest (Anonymous)	Full access to all personas and features. Chat history is session-only. Vault is session-only. Login prompted when saving is attempted.
Registered User	Persistent chat history across sessions. Persistent Jewelry Vault. Taste profile saved for future personalization. Access to usage history and liked items.
Authentication Method	To be recommended by a vendor. Suggested: Email/password + Google OAuth as minimum.

- Registration is never mandatory — friction-free anonymous experience is a priority
- Login prompt appears contextually: when user tries to save a chat, save a vault item, or at the end of a high-value session
    - **The "Save" Trigger:** If a guest user attempts to "Like" a product, add an item to their "Collection," or save a biometric size profile, the system shall immediately trigger a **Login/Register prompt**.
    - **Proactive Retention Messages:** The bot shall periodically use "Smart Pop-ups" or contextual messages to suggest registration.
    - *Example:* "I've analyzed your style as 'Modern Minimalist.' Would you like to **Register** so I can remember these preferences and your ring size for your next visit?"
- No credit card or payment information is ever processed within the chat

7. Admin Panel

A lightweight internal admin panel for the product owner and content team. Not user-facing. Must be functional and practical — not a design priority.

7.1 Knowledge Base Manager

- Upload new documents (PDF, text) to the RAG knowledge base
- Tag documents by persona relevance (e.g., 'Gemologist', 'Stylist', 'All')
- Manage the Trusted Domain list for web search guardrails
- View indexed document list with last-updated timestamps
- Delete or deprecate outdated documents

7.2 Conversation Review Dashboard

- View recent conversations across all personas
- Filter by persona, date, user type (guest vs. registered), and feedback rating
- Flag individual responses for review
- View the retrieved context chunks that generated each response (for RAG debugging)

- Mark responses as correct or incorrect to build the golden dataset

7.3 Analytics Dashboard

- Total conversations by persona (daily, weekly, monthly)
- Most common query topics per persona (NLP clustering)
- Thumbs up/down ratio per persona and globally
- Drop-off points: which turn in a conversation do users most commonly exit
- Zero-result and low-confidence query report: queries the system could not answer well
- User registration conversion rate: % of guest users who create an account
- Top web search queries and domains being used

7.4 System Configuration

- Persona tone toggle: adjust formality level per persona without a full redeploy
- Feature flags: enable/disable specific features per persona (e.g., disable image generation for a persona)
- Message rate limits: configure per-session and per-user daily message caps

8. Non-Functional Requirements

ID	Requirement	Target
NFR-001	API-First Architecture	All AI and data logic built as standalone API services. Frontend (PWA) and future native apps consume the same APIs with no duplication.
NFR-002	Mobile-First PWA	Full PWA compliance: Web App Manifest, Service Workers, Add to Home Screen, standalone display mode hiding browser chrome.
NFR-003	Response Latency	Text responses begin streaming within 3 seconds. Product card retrieval completes within 5 seconds.
NFR-004	Scalability	Infrastructure must support 1,000 to 10,000 concurrent users without significant latency degradation.
NFR-005	Data Freshness	Static knowledge base: daily sync acceptable. Pricing, news, and product data: real-time via live web search at query time.
NFR-006	Privacy & Compliance	GDPR and APPI compliant. All user data encrypted at rest and in transit. No PII processed in the chat window.

		Biometric/photo data handled with explicit consent and defined retention policy.
NFR-007	Security	Prompt injection guardrails. Domain restriction enforcement (non-jewelry topics refused). No bulk data extraction. API keys never exposed to clients.
NFR-008	Offline Capability	Core UI and cached conversation history available offline. Live features (search, AI responses) degrade gracefully with a clear 'you're offline' state.
NFR-009	Analytics Instrumentation	Event-driven frontend layer passing page context and user state to backend for analytics. Must be in place from day one — not retrofitted.
NFR-010	Native App Readiness	PWA architecture must cleanly convert to React Native or equivalent native app without backend refactoring. API contracts must be stable and versioned.

9. Questions for Vendors

Vendors responding to this BRD are asked to address the following in their proposal:

1. Recommended LLM vendor(s) and model(s) — including rationale and whether different personas would benefit from different models
2. Recommended vector database and RAG framework
3. Recommended image generation API for mood boards and concept renders
4. Recommended web search API and approach to trusted domain guardrails
5. Proposed authentication solution - login (default)
6. Proposed hosting infrastructure and cloud provider
7. Estimated cost breakdown: one-time build cost vs. ongoing monthly API/infrastructure costs at 100 - 1,000 DAU
8. Proposed development timeline with phases and milestones
9. Approach to prompt engineering and persona configuration — is this treated as a core deliverable with its own QA process?
10. Approach to hallucination minimization and RAG quality assurance
11. How the PWA will be architected for clean native app conversion
12. Any risks or concerns with the current scope that the vendor recommends revisiting
13. Is it possible to add Voice Input (Speech-to-Text): Useful but not critical for launch and how complex is it to add this feature?

10. Appendix — Persona Quick Reference

Persona	Core Domain	Image Upload	Web Search	Image Gen	Vault Access
My Gemologist	Gemstone science & grading	Yes	Yes	On request	No
My Stylist	Styling & fashion	Primary feature	Yes (styling refs)	Primary feature	Yes (read)
The Salesperson	Product discovery	Yes (inspiration)	Primary feature	On request	No
Gift Concierge	Gift discovery	Yes (recipient style)	Yes (products)	On request	No

— End of Document —
